Acid Etching Gel
A-250

Product Description

Americrete A-250 is an acid gel used for concrete surface preparation. Americrete A-250 is used to open up concrete surfaces of steel or hard troweled finishes, which increases the bond capabilities for any of Americrete coating systems. Americrete A-250 can be used for interior or exterior surfaces such as garage floors, walkways, pool decks, driveways and warehouse floors.

Coverage Rate

Americrete A-250 Acid Etching Gel will cover approximately 200 to 300 sq. ft. per gallon. It can be well agitated to loosen material for ease of application.

Primary Uses, Characteristics and Advantages

Americrete A-250 is a safe alternative to cleaning with muriatic acid. The gel form permits longer contact time, increasing etching and cleaning effectiveness. Americrete A-250 is biocompatible, has low fumes and is easy to use with minimal runoff. Americrete A-250 is non-flammable and easily contained for disposal, if necessary.

Application

Remove loose material from the surface. Shake or stir well before using. Pre-wet the surface and remove any standing water. Always test on a sample area before proceeding. Use an acid resistant brush, sponge, roller, or squeegee and apply evenly allowing A-250 to sit for a minimum of 5 minutes. Rinse with large amounts of water. Some surfaces may require a second application.
